Original instructions

The original instructions for this manual have been written in English. Other language versions of this manual are a translation of the original instructions

1 Certification

Certification documents follow on the next pages.
1.1 Declaration of conformity

EC Declaration of Conformity

1. 530 Cased pumps (Models: S, SN, U, UN, Du, DuN, Bp, BpN, En, EnN, Pn, PnN)
   630 Cased pumps (Models: S, SN, U, UN, Du, DuN, Bp, BpN, En, EnN, Pn, PnN)
   730 Cased pumps (Models: SN, UN, DuN, BpN, EnN, PnN)

2. Manufacturer:
   Watson Marlow Ltd
   Bickland Water Road
   Falmouth
   TR11 4RU
   UK

3. This declaration of conformity is issued under the sole responsibility of the manufacturer

4. All models and versions of the 530, 630 and 730 series of cased peristaltic pump with all approved pump heads, tubing and accessories.

5. The object of the declaration described above is in conformity with the relevant Union harmonisation legislation:
   - Machinery Directive 2006/42/EC
   - EMC Directive 2014/30/EC
   - ROHS Directive 2015/863

6. Harmonised standards used:
   - BS EN61010-1:2010 third edition Safety requirements for electrical equipment for measurement, control, and laboratory use Part 1: General requirements
   - EN61326-1:2013 Electrical equipment for measurement, control and laboratory use – EMC requirements Part 1: General requirements
   - BS EN 60529:1992+A2:2013 Degrees of protection provided by enclosures (IP code)

7. Intertek Testing and Certification Ltd, No: 3272281, performed compliance testing to UL 61010-1:2012 and CSA C22.2#61010-1-12:2012 and issued certification of compliance to these standards.

Signed for and behalf of:
Watson Marlow Ltd
Falmouth, December 2020

Simon Nicholson, Managing Director, Watson-Marlow Limited
In accordance with the Machinery Directive 2006/42/EC that if this unit is to be installed into a machine or is to be assembled with other machines for installations, it shall not be put into service until the relevant machinery has been declared in conformity.

We hereby declare that:

Peristaltic Pump

Series: 530, 630 and 730 cased pumps

the following harmonised standards have been applied and fulfilled for health and safety requirements:

Safety of Machinery – EN ISO 12100

Safety of Machinery – Electrical Equipment of Machines BS EN 60204-1

Quality Management System – ISO 9001

and the technical documentation is compiled in accordance with Annex VII(B) of the Directive.

We undertake to transmit, in response to a reasoned request by the appropriate national authorities, relevant information on the partly completed machinery identified above. The method of transmission shall be by mail or email.

The pump head is incomplete and must not be put into service until the machinery into which it is to be incorporated has been declared in conformity with the provisions of the Directive.

Person authorised to compile the technical documents:

Nancy Ashburn, Head of Design & Engineering, Watson-Marlow Ltd

Place and date of declaration: Watson-Marlow Ltd, 20.04.2020

Responsible person:

Simon Nicholson, Managing Director, Watson-Marlow Ltd
2 When you unpack your pump

2.1 Unpacking your pump
Unpack all parts carefully, retaining the packaging until you are sure all components are present and in good order. Check against the components supplied list, below.

2.2 Packaging disposal
Dispose of packaging materials safely, and in accordance with regulations in your area. The outer carton is made of corrugated cardboard and can be recycled.

2.3 Inspection
Check that all components are present. Inspect components for damage in transit. If anything is missing or damaged, contact your distributor immediately.

2.4 Components supplied

530 Components

- 530 pump drive unit, fitted with pumphead if specified as a pump
- The designated power cable (attached to the pump drive unit)
- A 530N module providing pump ingress protection to IP66, NEMA 4X, if a PnN.
- **Note:** the module is attached for transit, but must be removed to allow wiring up, voltage selection and fuse inspection and then re-affixed before the pump is operated.
- Product safety information booklet incorporating quick start manual

2.5 Storage
This product has an extended shelf life. However, care should be taken after storage to ensure that all parts function correctly. Please observe the storage recommendations and use-by dates which apply to tubing you may wish to bring into service after storage.
3 Information for returning pumps

Before returning products, they must be thoroughly cleaned/decontaminated. The declaration confirming this should be completed and returned to us in advance of the item being shipped. You are required to complete and return a decontamination declaration stating all fluids that have been in contact with the equipment being returned to us.

On receipt of the declaration, we will issue a Returns Authorisation Number. We reserve the right to quarantine or refuse any equipment that is not displaying a Returns Authorisation Number.

Please complete a separate decontamination declaration for each product and use the correct form that denotes the location you wish to return the equipment to. A copy of the appropriate decontamination declaration can be downloaded from the Watson-Marlow website at www.wmftg.com/decon.

If you have any queries then please contact your local Watson-Marlow representative for further assistance at www.wmftg.com/contact.

4 Peristaltic pumps - an overview

Peristaltic pumps are the simplest possible pump, with no valves, seals or glands to clog or corrode. The fluid contacts only the bore of a tube, eliminating the risk of the pump contaminating the fluid, or the fluid contaminating the pump. Peristaltic pumps can operate dry without risk.

How they work

A compressible tube is squeezed between a roller and a track on an arc of a circle, creating a seal at the point of contact. As the roller advances along the tube, the seal also advances. After the roller has passed, the tube returns to its original shape, creating a partial vacuum which is filled by fluid drawn from the inlet port.

Before the roller reaches the end of the track, a second roller compresses the tube at the start of the track, isolating a packet of fluid between the compression points. As the first roller leaves the track, the second continues to advance, expelling the packet of fluid through the pump’s discharge port. At the same time, a new partial vacuum is created behind the second roller into which more fluid is drawn from the inlet port.

Backflow and siphoning do not occur, and the pump effectively seals the tube when it is inactive. No valves are needed.

The principle may be demonstrated by squeezing a soft tube between thumb and finger and sliding it along: fluid is expelled from one end of the tube while more is drawn in at the other.

Animal digestive tracts function in a similar way.

Suitable applications

Peristaltic pumping is ideal for most fluids, including viscous, shear-sensitive, corrosive and abrasive fluids, and those containing suspended solids. They are especially useful for pumping operations where hygiene is important.

Peristaltic pumps operate on the positive displacement principle. They are particularly suitable for metering, dosing and dispensing applications. Pumps are easy to install, simple to operate and inexpensive to maintain.
5 Warranty

Watson-Marlow Limited ("Watson-Marlow") warrants this product to be free from defects in materials and workmanship for five years from the date of shipment, under normal use and service.

Watson-Marlow's sole responsibility and the customer's exclusive remedy for any claim arising out of the purchase of any product from Watson-Marlow is, at Watson-Marlow's option: repair, replacement or credit, where applicable. Unless otherwise agreed in writing, the foregoing warranty is limited to the country in which the product is sold. No employee, agent or representative of Watson-Marlow has the authority to bind Watson-Marlow to any warranty other than the foregoing unless in writing and signed by a director of Watson-Marlow. Watson-Marlow makes no warranty of the fitness of its products for a particular purpose.

In no event:

i. shall the cost of the customer's exclusive remedy exceed the purchase price of the product;

ii. shall Watson-Marlow be liable for any special, indirect, incidental, consequential, or exemplary damages, however arising, even if Watson-Marlow has been advised of the possibility of such damages.

Watson-Marlow shall not be liable for any loss, damage, or expense directly or indirectly related to or arising out of the use of its products, including damage or injury caused to other products, machinery, buildings, or property. Watson-Marlow shall not be liable for consequential damages, including without limitation, lost profits, loss of time, inconvenience, loss of product pumped, and loss of production.

This warranty does not obligate Watson-Marlow to bear any costs of removal, installation, transportation, or other charges which may arise in connection with a warranty claim.

Watson-Marlow shall not be responsible for shipping damage of returned items.

Conditions

- Products must be returned by pre-arrangement to Watson-Marlow, or a Watson-Marlow approved service centre.
- All repairs or modifications must have been made by Watson-Marlow Limited, or a Watson-Marlow approved service centre or with the express permission in writing of Watson-Marlow, signed by a manager or director of Watson-Marlow.
- Any remote control or system connections must be made in accordance to Watson-Marlow recommendations.
- All PROFINET® systems must be installed or certified by a suitably trained installation engineer.

Exceptions

- Consumable items including tubing and pumping elements are excluded.
- Pumphead rollers are excluded.
- Repairs or service necessitated by normal wear and tear or by lack of reasonable and proper maintenance are excluded.
- Products which, in the judgement of Watson-Marlow, have been abused, misused, or subject to malicious or accidental damage or neglect are excluded.
- Failure caused by electrical surge is excluded.
- Failure caused by incorrect or sub-standard system wiring is excluded.
- Damage by chemical attack is excluded.
- Ancillaries such as leak detectors are excluded.
- Failure caused by UV light or direct sunlight.
- All ReNu pumpheads are excluded
- Any attempt to disassemble a Watson-Marlow product will invalidate the product warranty.

Watson-Marlow reserves the right to amend these terms and conditions at any time.
6 Safety notes

This safety information should be used in conjunction with the rest of this operating manual.
In the interests of safety, this pump and pumphead should only be used by competent, suitably trained personnel after they have read and understood the manual and considered any hazard involved. If the pump is used in a manner not specified by Watson-Marlow Limited, the protection provided by the pump may be impaired. Any person who is involved in the installation or maintenance of this equipment should be fully competent to carry out the work. This person should also be familiar with all relevant health and safety protocols, regulations and guidance.

⚠️ This symbol, used on the pump and in the manual, means: An appropriate safety instruction should be followed or caution to a potential hazard exists.

🚫 This symbol, used on the pump and in the manual, means: Do not allow fingers to contact moving parts.

⚠️ This symbol, used on the pump and in the manual, means: Caution, hot surface.

⚠️ This symbol, used on the pump and in the manual, means: Caution, risk of electric shock.

👨‍⚕️ This symbol, used on the pump and in the manual, means: Personal Protective Equipment (PPE) must be worn.

🔥 This symbol, used on the pump and in the manual, means: Recycle this product under the terms of the EU Waste Electrical and Electronic Equipment (WEEE) Directive.

⚠️_within the 630 and 730 pumps there are thermal fuses which self-reset; if they trip, error code "Err17 Under Voltage" is displayed._
Fundamental work with regard to lifting, transportation, installation, starting-up, maintenance and repair should be performed by qualified personnel only. The unit must be isolated from mains power while work is being carried out. The motor must be secured against accidental start-up.

Some pumps weigh more than 18kg (the exact weight depends on the model and pumphead - see on the pump). Lifting should be performed according to standard Health and Safety guidelines. Finger recesses are built into the sides of the lower shell for convenience in lifting; in addition, the pump can conveniently be lifted by grasping the pumphead and (where fitted) the N Module at the rear of the pump.

There is a user-replaceable fuse located at the rear of the pump. Some country specific mains plugs contain an additional replaceable fuse. Fuses must be replaced with parts with the same rating.

There are no user-serviceable fuses or parts inside this pump. Note - the mains power supply cable is supplied hardwired into the pump and is not customer replaceable. Observe voltage selector switch setting for your region.

IP66 pumps are supplied with a mains plug. The gland at the NEMA Module end of the cable is IP66 rated. The mains plug at the opposite end of the cable is NOT IP66 rated. It is the user’s responsibility to ensure that the connection to the mains supply is IP66 rated.

This pump must be used only for its intended purpose. The pump must be accessible at all times to facilitate operation and maintenance. Access points must not be obstructed or blocked. Do not fit any devices to the drive unit other than those tested and approved by Watson-Marlow. Doing so could lead to injury to persons or damage to property for which no liability can be accepted.

The pump’s main plug is the disconnecting device (for isolating the motor drive from the mains supply in an emergency). Do not position the pump so that it is difficult to disconnect the mains plug.

If hazardous fluids are to be pumped, safety procedures specific to the particular fluid and application must be put in place to protect against injury to persons.
This product does not comply with the ATEX directive and must not be used in explosive atmospheres.

Ensure the chemicals to be pumped are compatible with the pumphead, lubricant (where applicable), tubing, pipework and fittings to be used with the pump. Please refer to the chemical compatibility guide which can be found at: www.wmftg.com/chemical. If you need to use the pump with any other chemical please contact Watson-Marlow to confirm compatibility.

If the Auto Restart feature is enabled it may cause the pump to start as soon as power is turned on.
Auto Restart only affects operation of Manual mode and PROFINET® mode.
If Auto Restart is enabled the “!” Symbol is shown on the screen to warn users that the pump may operate without any manual intervention (pump resumes with previous settings).
Do not use Auto Restart for more than:
• 1 mains power start per 3 minutes
We recommend remote control where a high number of starts is required.

If the pump is configured to Dispense or PROFINET® mode it will respond to remote commands at any time including immediately after power on. The pump may operate without any manual intervention (e.g. a remote setpoint could start the pump with no key press required).

There are moving parts inside the pumphead. Before opening the tool-unlockable guard or tool-unlockable track, ensure that the following safety directions are followed:
1. Ensure the pump is isolated from the mains power.
2. Ensure that there is no pressure in the pipeline.
3. If a tube failure has occurred, ensure that any fluid in the pumphead has been allowed to drain to a suitable vessel, container or drain.
4. Ensure that appropriate Personal Protective Equipment (PPE) is worn.

Primary operator protection from rotating parts of the pump is provided by the pumphead safeguard. Note that safeguards differ, depending on the type of pumphead. See the pumphead section of the manual.
## Pump specifications

Some pumps weigh more than 18 kg (the exact weight depends on the model and pumphead - see on the pump). Lifting should be performed according to standard Health and Safety guidelines. Finger recesses are built into the sides of the lower shell for convenience in lifting; in addition, the pump can conveniently be lifted by grasping the pumphead and (where fitted) the module at the rear of the pump.

7.2 Pumphead options

Figure 1 - 530 pump range

520R, 520R2, 520REH, 520REL, 520REM, 520RET, 505L, 505CA, 313, 314, 314MC and 318MC.
8  Good pump installation practice

8.1  General recommendations

It is recommended that the pump is sited on a flat, horizontal, rigid surface, free from excessive vibration, to ensure the correct lubrication of the gearbox and correct pumphead operation. Allow a free flow of air around the pump to ensure that heat can be dissipated. Ensure that the ambient temperature around the pump does not exceed the recommended maximum operating temperature. The STOP key on pumps supplied with a keypad will always stop the pump. However, it is recommended that a suitable local emergency stop device is fitted into the mains supply to the pump. Do not stack the pumps more than the recommended maximum number. When the pumps are stacked, ensure that the ambient temperature around all the pumps in the stack does not exceed the recommended maximum operating temperature.

![Figure 2 - Pump stacking](image)

The pump may be set up so that the direction of rotor rotation is clockwise or counter-clockwise, whichever is required.

Please note, however, that for some pumpheads the tube life will be greater if the rotor rotates clockwise; and that performance against pressure will be maximised if the rotor rotates counter-clockwise. To achieve pressure in some pumpheads the pump must rotate counter-clockwise.

![Figure 3 - Rotor direction](image)

Peristaltic pumps are self-priming and self-sealing against backflow. No valves are required in inlet or discharge line, except those specified as below.

![Users must fit a non-return valve between the pump and the discharge pipework to avoid the sudden release of pressurised fluid in the event of a pumphead or tube failure. This shall be fitted immediately after the discharge of the pump.](image)

Valves in the process flow must be opened before the pump operates. Users are advised to fit a pressure relief device between the pump and any valve on the discharge side of the pump to protect against damage caused by accidental operation with the discharge valve closed.
### 8.2 Dos and don’ts

- Do not build a pump into a tight location without adequate airflow around the pump.
- Do keep delivery and suction tubes as short and direct as possible - though ideally not shorter than one metre - and follow the straightest route. Use bends of large radius: at least four times the tubing diameter. Ensure that connecting pipework and fittings are suitably rated to handle the predicted pipeline pressure. Avoid pipe reducers and lengths of smaller bore tubing than the pumphead section, particularly in pipelines on the suction side. Any valves in the pipeline must not restrict the flow. Any valves in the flow line must be open when the pump is running.
- Do ensure that on longer tube runs at least one metre of smooth bore, flexible tubing is connected to the inlet and discharge port of the pumphead to help to minimise impulse losses and pulsation in the pipeline. This is especially important with viscous fluids and when connecting to rigid pipework.
- Do use suction and delivery pipes equal to or larger than the tubing diameter bore. When pumping viscous fluids use pipe runs with a bore several times larger than the pump tube.
- Do site the pump at or just below the level of the fluid to be pumped if possible. This will ensure flooded suction and maximum pumping efficiency.
- Do run at slow speed when pumping viscous fluids. Flooded suction will enhance pumping performance, particularly for materials of a viscous nature.
- Do recalibrate after changing tubing, fluid or any connecting pipework. It is also recommended that the pump is recalibrated periodically to maintain accuracy.
- Do not pump any chemical not compatible with the tube or pumphead.
- Do not run the pump with no tube or element fitted to the pumphead.
- Do not strap the control and mains cables together.
- Do ensure if your product has an N module, that the module is fitted with the seals intact and properly located. Ensure that the holes for the cable glands are properly sealed to maintain the IP/NEMA rating.

**Tube selection:** The chemical compatibility guide published on the Watson Marlow website is for guidance. If in any doubt about the compatibility of a tube material and the duty fluid, request a Watson-Marlow tube sample card for immersion trials.

When using Marprene or Bioprene continuous tubing, do re-tension the tube after the first 30 minutes of running.
9 Pump operation

9.1 Keypad layout and key IDs

Figure 4 - Keypad layout and key IDs

HOME key
When the HOME key is pressed it will return the user to the last known operating mode. If modifying pump settings when the HOME key is pressed, it will disregard any setting changes and return you to the last known operating mode.

FUNCTION keys
FUNCTION keys, when pressed, will perform the function displayed on the screen directly above the relevant function key.

∧ and ∨ keys
These keys are used to change the programmable values within the pump. These keys are also used to move the selection bar up and down in the menus.

MODE key
To change modes or mode settings, press the MODE key. The MODE key can be pressed at any time to enter the mode menu. If modifying pump settings when the MODE key is pressed, it will disregard any setting changes and return you to the MODE menu.
9.2 Starting and stopping

Figure 5 - Starting and stopping

9.3 Using up and down keys

Figure 6 - Using up and down keys

9.4 Maximum speed

Figure 7 - Maximum speed

9.5 Change rotation direction

Figure 8 - Change rotation direction
10 Connecting to a power supply

A well regulated electrical mains supply is required along with cable connections conforming to the best practice of noise immunity. It is not recommended to site these drives alongside electrical devices that may generate mains-borne noise, for example 3-phase contactors and inductive heaters.

Set the voltage selector to 115 V for 100-120 V 50/60 Hz supplies or 230 V for 200-240 V 50/60 Hz supplies. Always check the voltage selector switch before connecting to the mains supply or the pump will be damaged.

Make suitable connection to an earthed single-phase mains electricity supply.

If the pump type is one with an N Module, the voltage selector is not visible while the module is in place. It is mounted in the switch plate at the rear of the pump, protected from water by the N Module. The module must be removed to allow access to the switch plate. Do not switch the pump on unless you have checked that it is set to suit your power supply by removing the module and inspecting the switch and then refitting the module.

Figure 9 - Voltage selector

We recommend using a commercially available supply voltage surge and/or noise suppression where there is excessive electrical noise.

Ensure that all power supply cables are adequately rated for the equipment. Only use with supplied power cable.

The pump must be positioned so that the disconnection device is easily accessible when the equipment is in use. The pump's power input plug is the disconnecting device (for isolating the motor drive from the power supply in an emergency).
IP66 pumps are supplied with a mains plug. The gland at the NEMA Module end of the cable is IP66 rated. The mains plug at the opposite end of the cable is NOT IP66 rated. It is your responsibility to ensure that the connection to the mains supply is IP66 rated.

</tbody>
</table>

10.2 Wiring the NEMA module - PROFINET® pumps

The NEMA 4X modules fitted to 530, 630 and 730 PnN cased pumps have two pairs of wiring ports. Two M16 ports are provided, together with glands to seal circular cross-section cables ranging in diameter from 4 mm to 10 mm (5/32 in to 13/32 in.) PROFINET connection is via the two M12 connectors mounted to the rear of the NEMA module.

*Figure 10 - Earth screening of control cables on PROFINET® NEMA module*

Control cable earth screening connected to Earth terminal (J6) on adapter PCB when plastic cable gland is used.
No additional control cable earth screening required when EMC gland is used.

NEMA module with conductive mounting kit (for connecting screen to earth for PROFINET®).
11 Start-up check list

**Note:** See also "Tube replacement " on page 138.

- Ensure that proper connections are achieved between the pump and suction and discharge piping.
- Ensure proper connection has been made to a suitable power supply.
- Ensure that the recommendations in the section "Good pump installation practice" on page 14 are followed.

12 PROFINET® control wiring

![Warning]

Never apply mains power to the D-connectors. Apply the correct signals to the pins shown. Limit signals to the maximum values shown. Do not apply voltage across other pins. Permanent damage, not covered by warranty, may result.

![Warning]

Keep 4-20 mA and low voltage signals separate from mains power. Use separate glanded input cables. Following best EMC practice and use of shielded glands is recommended.
12.1 Features on the rear of the pump

1. RJ45 connection 1
2. RJ45 connection 2
3. Standard - 9 way D - Sensor connector (Female)
4. USB (Type A) port for service use only
5. Voltage selector switch
6. On/Off switch
7. Mains power cable
8. Customer replaceable fuse
12.2 **RJ45 connections**

Connect an RJ45 (CAT5 or above, shielded recommended) network cable from the PC to the pump connection port 1 or 2.

12.4  N Module and F Module

Never apply mains power to the M12 connectors. Apply the correct signals to the terminals. Limit signals to the maximum values shown. Do not apply voltage across other terminals. Permanent damage, not covered by warranty, may result.

The recommended cable and cable glands must be used for the IP66 (NEMA 4X) version of the pump; otherwise ingress protection may be impaired.

Ensure that the module cover is correctly secured at all times by all screws supplied. Failure to do so may compromise the IP66 (NEMA 4X) protection.

Ensure that unused openings on the module are sealed using the blanking plugs provided. Failure to do so may compromise the IP66 (NEMA 4X) protection.

</table>
PROFINET (Industrial Ethernet) connection

There are two communication connectors on the rear of the N Module for PROFINET (Industrial Ethernet) connection (3,4). Both connectors have the same pin configuration. The pin configuration and the signal response is shown below.

Plugs and cables for these connectors should be: M12, male, 4-Pin D coded, shielded.

![PROFINET connection diagram]

**Figure 14 - Ethernet connection**

**Adapter PCB**

**Figure 15 - Adapter PCB**

| 1. Without isolated power supply option (N Module) | 2. With isolated power supply option (F Module) |

Note: Disconnect the adapter module by use of the ribbon eject levers. It is recommended to leave the 9W connector permanently attached to the pump.

Recommended control cable: metric = 0.05 sq mm - 1.31 sq mm solid and stranded. USA = 30AWG - 16AWG solid stranded. Cable: circular. Max/min outside diameter to ensure a seal when passed through the standard gland: 9.5 mm-5 mm. **The cable section must be circular to ensure a seal.**
Power supply options
The NEMA adapter board is available with an isolated power supply option (F-Module). This has a 24 V isolated power supply (maximum output load 80 mA), U1, fitted. As shown below, U1 completely separates the terminal 24 V and 0 V from the pump internal supplies.

The F-Module option may be used if the sensor requires an isolated supply or has a 4-20 mA output which cannot be used with the ground connected load resistor within the pump.

**Figure 16 - Power supply options**

---

**Note:** Images not included in the natural text representation.
13 **Switching the pump on for the first time**

1. Power up the pump. The pump displays the start-up screen with the Watson-Marlow Pumps logo for three seconds.

13.1 **Selecting the display language**

1. Use the \(\wedge/\vee\) keys to select your chosen language, and press **SELECT**.
2. Your selected language will now be displayed on screen. Choose **CONFIRM** to continue. All text will now appear in your chosen language.

3. Choose **REJECT** to return to the language choice screen. This then proceeds to the home screen.
13.2 First-time start-up defaults

If the Auto Restart feature is enabled it may cause the pump to start as soon as power is turned on. Auto Restart only affects operation of Manual mode and PROFINET® mode. If Auto Restart is enabled the "!" Symbol is shown on the screen to warn users that the pump may operate without any manual intervention (pump resumes with previous settings). Do not use Auto Restart for more than:

- 1 mains power start per 3 minutes

We recommend remote control where a high number of starts is required.

If the pump is configured to Dispense or PROFINET® mode it will respond to remote commands at any time including immediately after power on. The pump may operate without any manual intervention (e.g. a remote setpoint could start the pump with no key press required).

The pump is preset with operational parameters as shown in table below.

<table>
<thead>

</tr>
</tbody>
</table>

The pump is now ready to operate according to the defaults listed above.

Note: The display background colour changes according to running state as follows:

- White background indicates pump stopped
- Grey background indicates pump running
- Red background indicates error or alarm

All operating parameters may be changed by means of key-presses (see section "Pump operation" on page 16).
14 Switching the pump on in subsequent power cycles

If the Auto Restart feature is enabled it may cause the pump to start as soon as power is turned on.
Auto Restart only affects operation of Manual mode and PROFINET® mode.
If Auto Restart is enabled the "!" Symbol is shown on the screen to warn users that the pump may operate without any manual intervention (pump resumes with previous settings).
Do not use Auto Restart for more than:
• 1 mains power start per 3 minutes
We recommend remote control where a high number of starts is required.

If the pump is configured to Dispense or PROFINET® mode it will respond to remote commands at any time including immediately after power on. The pump may operate without any manual intervention (e.g. a remote setpoint could start the pump with no key press required).

Subsequent power-up sequences will jump from the start-up screen to the home screen.
• The pump runs a power-on test to confirm proper functioning of the memory and hardware. If a fault is found, an error code is displayed.
• The pump displays the start-up screen with the Watson-Marlow Pumps logo for three seconds followed by the home screen
• Start-up defaults are those in place when the pump was switched off last
Check that the pump is set to operate as you require it. The pump is now ready to operate.
All operating parameters may be changed by means of key-presses (see "Pump operation" on page 16).

Power interruption
This pump has an Auto Restart feature (which only affects Manual mode) which, when active, will restore the pump to the operating state it was in when power was lost.

Stop/start power cycles
Do not power up/power down the pump more than 20 times in an hour, whether manually or by means of the Auto Restart facility (which only affects Manual mode). We recommend remote control where a high frequency of power cycles is required.
15  Main menu

1. To access the MAIN MENU press the MENU button from one of the HOME screens or INFO screens.

2. This will display the MAIN MENU as shown below. Use the ∧ / ∨ keys to move the selection bar between the available options.

3. Press SELECT to choose an option.
4. Press **EXIT** to return to the screen from where the MENU was called.

15.1 **Security settings**

Security settings can be changed by selecting **SECURITY SETTINGS** from the Main menu.
Auto keypad lock

Note: Auto keypad lock is not supported in Dispense mode.

1. Press ENABLE/DISABLE to switch on/off the Auto keypad lock. When active the keypad will lock after 20 seconds of inactivity.

2. Once locked it will display the screen below when any key is pressed. To unlock the keypad press the two UNLOCK keys together.

3. The padlock icon will appear on the operating mode home screen to show that keypad lock is activated.

4. Note that the STOP key will always work whether the keypad is locked or not.

PIN protection

Using the ▲ / ▼ keys select PIN protection from the SECURITY SETTINGS menu and press ENABLE/DISABLE to switch on/off the PIN protection. If PIN protection has been enabled, a Master level PIN will be required to disable PIN lock.

Setting Master PIN

PIN will enable after one minute from the last time the PIN was entered.
Setting the Master PIN protects all functionality. The Master is able to selectively enable functionality for two additional operators. These are defined as User 1 and User 2. They will be able to access this functionality by entering a PIN code assigned to them by the Master user.

1. To set the Master PIN, scroll to Master level and press ENABLE.

2. To define a four digit Master PIN, use the ▲/▼ keys to select each digit from 0-9. Once you have the required digit press the NEXT DIGIT key. After selecting the fourth digit press ENTER.
3. Now press **CONFIRM** to check that the number entered is the PIN you require. Press **CHANGE** to return to PIN entry.

4. The following screen will be displayed to indicate that the Master PIN has been applied to access all functionality. Press **NEXT** to selectively enable functionality access for User 1 and User 2.
Configure User 1 security settings

1. The PIN PROTECTION level screen will be displayed with User 1 highlighted, press ENABLE to configure User 1 security settings or scroll to configure an alternative User.

   ![](image1)

2. ENABLE user 1 security settings displays the PIN entry screen for User 1. To define a four digit User 1 PIN, use the ▲/▼ keys to select each digit from 0-9. Once you have the required digit press the NEXT DIGIT key. After selecting the fourth digit press ENTER.

   ![](image2)
3. Now press CONFIRM to verify that the number entered is the PIN you require. Press CHANGE to return to PIN entry.

4. To define the allowed functionality, use the∧ / keys to select the functionality and press ENABLE. User 1 PIN will allow access to only the enabled functionality, to disable functionality, highlight the enabled functionality and press DISABLE. When all the required functionality has been enabled, press FINISH.
Configure User 2 security settings

1. The PIN PROTECTION LEVEL screen will be displayed with User 2 highlighted, press ENABLE to configure User 2 security settings or scroll to configure an alternative User.

![PIN protection level screen](image1)

2. ENABLE user 2 security settings displays the PIN entry screen for User 2. To define a four digit User 2 PIN, use the \(\wedge/\vee\) keys to select each digit from 0-9. Once you have the required digit press the NEXT DIGIT key. After selecting the fourth digit press ENTER.

![PIN entry screen](image2)
3. To define the allowed functionality, use the ∧/∨ keys to select the functionality and press **ENABLE**. User 2 PIN will allow access to only the enabled functionality, to disable functionality, highlight the enabled functionality and press **DISABLE**. When all the required functionality has been enabled, press **FINISH**.

![Diagram of control panel](image)

**Note**: Once Security Settings for User 1 and User 2 have been set by the Master, only the Master PIN will allow access to Security Settings.

4. The **HOME** screen will be displayed. A PIN is now required to access all functionality. The Master PIN accesses all pump functionality and the User 1 and User 2 PINs access only the defined functionality. To enter the PIN, use the ∧/∨ keys to select each digit from 0-9. Once you have the required digit press the **NEXT DIGIT** key. After selecting the fourth digit press **ENTER**.

![Diagram of security settings](image)
5. If an incorrect PIN has been entered the following screen will be displayed. NOTE: this screen will also display if the PIN entered does not allow access to that functionality.

6. If a PIN number is entered that is already in use, the following screen will be displayed, press CHANGE to input an alternative PIN or EXIT to abort.
7. If the PIN entered does not allow access to the functionality the following screen will be displayed.

Keypad beep

1. From SECURITY SETTINGS scroll to Keypad beep using the \( \wedge / \vee \) keys and select ENABLE. The pump will now beep at every key press.
PIN entry on start-up

The setting **PIN entry during start-up** can be used to configure the software to choose if PIN entry is required during start up.

This feature also means that **Auto Restart** capability is now independent of PIN code entry after start up.

If this setting is enabled ✓ then the pump will require the PIN code to be entered before the pump will enter the home control screen after a power cycle.

If this setting is disabled ✗ then the pump will not require the PIN code to be entered before the pump will enter the home control screen after a power cycle.

The **Auto Restart** response of the pump after a power cycle is now independent of PIN entry.

The default setting, is enabled ✓ so a PIN code will be required after a power cycle before the pump will enter the home control screen.

Disabling this feature does not change any other aspects of PIN code operation. Anyone wishing to modify pump settings will still need to enter the PIN code.

### 15.2 General settings

To view the general settings menu, select **GENERAL SETTINGS** from the main menu.

**Auto restart**

This pump includes a feature called **Auto Restart**.

When **Auto Restart** is enabled it will cause the pump to remember it's current operating settings when power is lost and to resume using these as soon as power comes back on.

The ! symbol is also displayed when the **Auto Restart** feature is enabled to warn users that the pump has been configured in a way that could result in unexpected operation.

1. Press **ENABLE/DISABLE** to turn the **Auto Restart** feature on/off (Manual mode).

---

**Warning:** Do not use Auto Restart for more than 20 mains power starts per hour. We recommend remote control where a high number of starts is required.
If the Auto Restart feature is enabled it may cause the pump to start as soon as power is turned on.

Auto Restart only affects operation of Manual mode and PROFINET® mode.

If Auto Restart is enabled the "!" Symbol is shown on the screen to warn users that the pump may operate without any manual intervention (pump resumes with previous settings).

Do not use Auto Restart for more than:

- 1 mains power start per 3 minutes

We recommend remote control where a high number of starts is required.

If the pump is configured to Dispense or PROFINET® mode it will respond to remote commands at any time including immediately after power on. The pump may operate without any manual intervention (e.g. a remote setpoint could start the pump with no key press required).

Flow units

The current chosen flow unit is displayed on the right hand side of the screen. To change flow units move the selection bar over the flow unit menu entry and press SELECT.

1. Use the ↑/↓ keys to move the selection bar over the required flow unit, then press SELECT. All flow rates displayed on screens will now be in the chosen units.
2. If a mass flow unit is selected, the specific gravity of the fluid must be entered. The following screen is displayed.

3. Use the \( \wedge \) / \( \vee \) keys to enter the value of the specific gravity, and press SELECT.

**Pump label**

The pump label is a user defined 20 digit alphanumeric label which is displayed in the header bar of the home screen. To define or edit the pump label, move the selection bar over the Pump label menu entry and press SELECT. If a pump label has been previously defined, this will be displayed on screen to allow editing, otherwise it will display the default label "WATSON-MARLOW".

1. Use the \( \wedge \) / \( \vee \) keys to scroll through the available characters for each digit. The available characters are 0-9, A-Z and SPACE.
2. Press **NEXT** to move onto the next character, or **PREVIOUS** to move back to the previous character.

3. Press **FINISH** to save the entry and return to the general settings menu.

**Asset number**

The Asset number is for users to set a unique asset identification code for the pump. This can help to track pumps on the network and distinguish between different pumps on the network. There is no default factory setting for this parameter and new pumps are supplied without an asset number.
Setting up the asset number.

1. From the main menu, using the ↑ / ↓ keys, scroll to General settings and press SELECT.

2. Using the ↑ / ↓ keys, scroll to Asset number and press SELECT.
3. Using the ▲ / ▼ keys, enter a character.

4. There are 20 character slots. Press NEXT to confirm your character and to move onto the next. Press PREVIOUS to return to the last character slot.
5. Once you have filled the character slots press **FINISH**. This will return you to the **GENERAL SETTINGS** screen.

![General Settings Screen](image)

6. Power the pump off and on again to apply the asset number.

**Failsafe speed**

A failsafe speed is a dedicated speed the pump uses if an error occurs. Use this to prevent the pump stopping in the event of an error.

**Example:** disconnect the RJ45 cable from the pump while running on PROFINET® mode and the pump will error.

- If failsafe speed is enabled, the pump will run at the failsafe speed and the network error message will display.
- If failsafe speed is not enabled, the pump will stop running and the network error message will display.

Once the error is acknowledged, the pump will run as normal.

**Pumphead type**

1. Select **GENERAL SETTINGS** from the main menu.

![Main Menu Screen](image)
2. Use the \( \wedge \) / \( \lor \) keys to move the selection bar over **Pumphead type** and press **SELECT**. The following screen will be displayed.

3. Use the \( \wedge \) / \( \lor \) keys to move the selection bar over **Pumphead** and press **SELECT**.
4. Use the \( \wedge / \vee \) keys to move the selection bar over the required pumphead type and press SELECT.

**Tube size and tube material**

1. Select **Tube size** from **GENERAL SETTINGS**, then use the \( \wedge / \vee \) keys to move the selection bar over **Bore size** and press **SELECT**.
2. Use the \( \uparrow \downarrow \) keys to move the selection bar over the tube size to be used and press SELECT.

3. If a LoadSure element has been selected then the tube size is displayed as pressure and bore.
4. This screen also allows you to select the tube material used. Use the ∧ / ∨ keys to move the selection bar over **Tube material** and press **SELECT**.

5. Use the ∧ / ∨ keys to move the selection bar over the tube material to be used and press **SELECT**.

6. The **PUMPHEAD MODEL** screen allows the tube Lot Number to be recorded for future reference. Using the ∧ / ∨ keys, scroll to **Tube lot number** and press **SELECT**.

7. Use the ∧ / ∨ keys to scroll through the available characters for each digit. The available characters are 0-9, A-Z, and SPACE.
8. Press **NEXT** to move onto the next character, or **PREVIOUS** to move back to the last character.

![LOT NUMBER]

Define tube batch number:
123456789
Use +/- keys to select characters (0/1/max)

9. Press **FINISH** to save the entry and return to the general settings menu.
**Restore defaults**

1. To restore the factory default settings select **Restore defaults** from the **GENERAL SETTINGS** menu.

2. There are two confirmation screens to ensure that this function is not carried out in error.

3. Press **CONFIRM** followed by **RE-CONFIRM** to restore the defaults.

**Language**

1. Select language from the **GENERAL SETTINGS** menu to choose an alternative display language for the pump. The pump must be stopped before changing the language.
2. Using the ▲ /▼ keys, scroll to your required language. Press SELECT to confirm.

3. Your selected language will now be displayed on screen. Press CONFIRM to continue, all displayed text will now appear in your chosen language.

4. Press REJECT to return to the language choice screen.

15.3 Change mode

Selecting CHANGE MODE menu from the main menu will navigate you to access the sub-menu shown below. This is the same as pressing the MODE key. Please see "Mode menu " on page 73 for further details.
15.4 Control settings

1. Select **CONTROL SETTINGS** from the **MAIN MENU** to access the sub menu shown below. Use the ∧/∨ keys to move the selection bar. Press **SELECT** to choose the required function.

![Control Settings Menu](image)

**Speed limit**

The maximum speed the pump is capable of running at is 220 rpm.

1. Select **Speed limit** from the **CONTROL SETTINGS** menu to define a lower maximum speed limit for the pump. This speed limit will be applied to all operating modes.

2. Use the ∧/∨ keys to adjust the value and press **SAVE** to set.

**Reset run hours**

1. Select **Reset run hours** from the **CONTROL SETTINGS** menu.

2. Select **RESET** to zero the run hours counter. The run hours counter can be viewed by pressing **INFO** from your home screen. The following screen will be displayed. Press **RESET** to reset the run hours or **CANCEL** to return to the **CONTROL SETTINGS** menu.

![Reset Run Hours](image)
15.5 Configure inputs

1. Select Configure inputs from the CONTROL SETTINGS menu.

2. Use the ∧/∨ keys and press SELECT to choose which input to configure.

3. Use the ∧/∨ keys and press SELECT to choose the logic state of the chosen input.

4. Press SELECT to program the output or BACK to cancel.

5. NOTE: On this model, Inputs 4 and 5 are configured for a pressure sensor.
Disable remote stop in Manual mode

1. Users can disable/enable the remote stop input when the pump is in **Manual** mode by using the following sequence to configure the **start/stop** settings.

2. The default is ×. The start/stop input is not disabled in **Manual** mode. Press **SELECT** to change the setting to ✓.
3. Press **HOME** to return and store the setting. The input is now disabled in **Manual** mode.
Enable remote stop in Manual mode

1. The setting is ✓. The start/stop input is disabled. Press SELECT to open the logic state menu.

2. Use the ∧/∨ keys and press SELECT to choose the logic state of the chosen input for your connected control hardware.
3. Press **HOME** to return and store the setting. The input is now enabled in **Manual** mode.
15.6 **Help**

**Help**

1. Select Help from the main menu to access the help screens.
16 Mode menu

1. Press MODE to display the CHANGE MODE menu.
2. Use the ∧ / ∨ keys to scroll through the available modes.
   - Manual (default)
   - Flow Calibration
   - PROFINET
   - Dispense
   - BACK
3. Use SELECT to choose mode. Use the right hand function key to alter mode settings.
17 Manual

All settings and functions of the pump in Manual mode are set and controlled by means of key-presses. Immediately after the start-up display sequence detailed in: "Switching the pump on in subsequent power cycles " on page 40, the Manual mode home screen will be displayed unless Auto Restart is enabled.

If Auto Restart is enabled the pump will return to the last known settings when the power is re-applied. When the pump is running it displays an animated clockwise arrow. In normal operation, the direction of flow is into the bottom port of the pumphead and out of the top port.

If an exclamation mark (!) is displayed, it indicates that the pump could automatically restart at any time. In Manual mode, the Auto Restart behaviour is configurable. If a padlock icon shows, it indicates that the keypad lock is on.

17.1 Start

1. Starts the pump, and the display background changes to grey. If the pump is already running, pressing this has no effect.
17.2 **Stop**

1. Stops the pump. The display background changes to white. If the pump is not running pressing this has no effect.

17.3 **Increasing and decreasing flow rate**

1. Using the ▲ / ▼ keys will increase or decrease the flow rate.

**Decreasing flow rate**

- A single key press will decrease flow rate by the least significant digit of the chosen flow rate unit.
- Repeat key presses as required to achieve the desired flow rate.
- Hold down the key for flow rate scrolling.

**Increasing flow rate**

- A single key press will increase flow rate by the least significant digit of the chosen flow rate unit.
- Repeat key presses as required to achieve the desired flow rate.
- Hold down the key for flow rate scrolling.
MAX FUNCTION (Manual mode only)

1. Using the MAX key:

- Press and hold the **MAX** key to run at maximum flow.
- Release the key to stop the pump.
- The volume pumped and time elapsed are displayed while the **MAX** key is pressed and held.
18  Flow calibration

This pump displays flow rate in ml/min.

18.1  Setting the flow calibration

1. Using the ▲ /▼ keys, scroll to Flow calibration and press CALIBRATE.

2. Using the ▲ /▼ keys, enter the maximum flow rate limit and press ENTER.
3. Press **START** to begin pumping a volume of fluid for calibration.

4. Press **STOP** to stop pumping fluid for the calibration.
5. Use the ▲ / ▼ keys to enter the actual volume of fluid pumped.

6. To accept the new calibration press ACCEPT or RE-CALIBRATE to repeat the procedure. Press HOME or MODE to abort.

7. The pump is now calibrated.
19 PROFINET® mode

19.1 Behaviour on start up

IOPS = bad

If the Input Output Provider Status (IOPS) associated with a sub module is BAD (any value other than 0x80), then the I/O data of that sub module as viewed over PROFINET® will be cleared to zeroes. The equivalent parameters viewed on the TFT screen, or over the web interface, are not cleared. Upon receiving a network message with IOPS=BAD, no parameters of the pump that were attempted to be written will be updated, and the Network Status LED will flash once in green. The pump will continue to respond normally however, to any valid future messages. By default, the motor will stop if IOPS=BAD, but this behaviour can be customised using the failsafe settings.

Disconnection

If a PROFINET® connection is aborted (for example, the Ethernet cable is disconnected), then the I/O data of all sub modules as viewed over PROFINET® are cleared to zeroes. The equivalent parameters viewed on the TFT screen, or over the web interface, are not cleared. New connections may be established without needing to reboot the pump. By default, the motor will stop upon losing connection, but this behaviour can be customised using the failsafe settings.

Mains power on

The I/O data of all sub modules as viewed over PROFINET® will be cleared to zeroes. This does not clear the parameters stored on the pump itself.

By default, the motor is stopped on power on, however this behaviour can be modified using the Auto Restart setting, and also the Resume Interrupted setting if in Dispense mode.

<td>IP Address</td>
</tr>
<tr>
<td>Subnet mask</td>
</tr>
<tr>
<td>Gateway address</td>
</tr>
</tbody>
</table>
1. Press the **MODE** key to access the **MODE** menu.

2. Use the \(\wedge\) / \(\vee\) keys to select **PROFINET**.
3. Press the SELECT key to use PROFINET® mode.

4. Press the SETTINGS key to access the PROFINET® SETTINGS menu.

Setting DHCP Enable

1. Press the DISABLE key to set DHCP Enable to Off.

Setting the IP Address, Subnet mask and Gateway address

Configure each of the IP Address, subnet mask and gateway address in turn using the following method:
1. Use the \( \wedge / \vee \) keys to select the setting to configure. Press \textit{SET} to enter the \textit{SET ADDRESS} menu.

![Image of a device with a menu screen showing PROFINET SETTINGS with options such as DHCP Enable, IP Address, Subnet Mask, Gateway Address, and MAC Address.]

2. Use the \( \wedge / \vee \) keys to set the first number. Hold the \( \wedge / \vee \) key increase the scrolling speed. Press \textit{NEXT} to move to the next number.

![Image of a device with a menu screen showing a set address of 123.456.789.101.]

3. After setting the last number, press \textit{CONFIRM} to store the number and return to the \textit{PROFINET® SETTINGS} screen.
4. Press **BACK** to return to the **MODE MENU**.
19.3 PROFINET® mode

1. From the CHANGE MODE menu, highlight PROFINET® and press SELECT to use PROFINET® mode.

2. The pump display will show a network error as indicated below if the pump is not connected to a PROFINET® controller.

3. If the pump is connected to a PROFINET® controller, press INFO to display the network settings.

19.4 Pump parameters

All available pump parameters are grouped in to modules as listed below:

- Pump Details and set up
- Pump Status
- Pump Control
- Errors and Warnings
- Dispense
<table>

19.5 GSDML compatibility guide

Table 17 - GSDML compatibility guide

<table>
<thead>
<tr>
<th>GSDML file (Found on website)</th>
<th>GSDML release Date</th>
<th>Pump Models</th>
<th>Compatible with pump software versions</th>
<th>Version comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>GSDML-V2.4-Watson Marlow-530_630_730 Profinet Pump-20211116.xml</td>
<td>January 2021</td>
<td>530Pn, 630Pn, 730Pn</td>
<td>0.41.03</td>
<td>Initial GSDML release</td>
</tr>
</tbody>
</table>

Link to GSDML file location:

Notes:
1. If your pump software is compatible with multiple GSDML files versions it is recommended to use the latest version available.
2. In order to find your pump software version, select Help, then Software on your pump.
3. The correct GSDML file version must be used in combination with the pump software versions listed for good communication between the pump and control system.
4. Networks using pumps with different software and GSDML versions are acceptable as long as each pump is using the correct GSDML version.
20 Dispense mode

In this mode, the pump will dispense a batch of doses of the specified volume. Follow these steps to use Dispense mode:

1. "Create a new recipe or edit a recipe" below
2. "Create a new batch or edit a batch" on page 98
3. "Set the active batch" on page 102
4. "Start dispensing" on page 104

20.1 Create a new recipe or edit a recipe

Note: the pump must be stopped to enter DISPENSE SETTINGS.

1. Press MODE to display the CHANGE MODE menu.
2. Using the ∨/∧ keys, scroll to **Dispense** and press **SETTINGS**.

3. Using the ∨/∧ keys, scroll to **Recipes** and press **SELECT**.
4. Using the $\uparrow / \downarrow$ keys, scroll to Add new recipe and press SELECT to create a new recipe. The ADD RECIPE screen is displayed. Alternatively scroll to a recipe name and press SELECT to edit that recipe. The EDIT RECIPE screen is displayed.

Press SELECT to edit a parameter. Set each parameter to the desired value. See "Recipe parameters" on page 107 for a description of the parameters.
5. To enter a recipe name:
   • Using the ▲/▼ keys, enter a character.
   • Press NEXT to confirm your character and to move onto the next. Press PREVIOUS to move the cursor back one character.
   • Move the cursor to the end or beginning of the entry field using NEXT or PREVIOUS. When the cursor is at the beginning or end of the entry field, press FINISH to store the entry.

6. Use the ▲/▼ key to highlight any of the remaining parameters and press SELECT.
7. Use the ▲/▼ keys to adjust the value as desired and press SET.
8. If you have created a new recipe highlight Save and press SELECT.
9. If you have edited an existing recipe highlight Save and press SELECT to overwrite or to save as a new recipe highlight Save as and press SELECT.
10. Press FINISH to confirm. This will complete the editing, save and return to the RECIPE screen.
20.2  Create a new batch or edit a batch

Note: the pump must be stopped to enter DISPENSE SETTINGS.

1. Press **MODE** to display the **CHANGE MODE** menu.

2. Using the \(\wedge/\vee\) keys, scroll to **Dispense** and press **SETTINGS**.
1. Highlight **Batches** and press **SELECT**.

2. Highlight **Add new batch** and press **SELECT** to create a new batch or highlight a batch name and press **SELECT** to edit that batch. The **EDIT BATCH** screen is displayed.
3. Press SELECT to edit a parameter. Set each parameter to the desired value. See “Batch parameters” on page 106 for a description of the parameters.

4. Enter a batch name:
   • Using the ∧/∨ keys, enter a character.
   • Press NEXT to confirm your character and to move onto the next. Press PREVIOUS to move the cursor back one character.
   • Move the cursor to the end or beginning of the entry field using NEXT or PREVIOUS. When the cursor is at the beginning or end of the entry field, press FINISH to store the entry.

5. Use the ∧/∨ keys to highlight Active Recipe and press SELECT.
6. Use the \( \uparrow \downarrow \) keys to highlight the desired recipe and press SELECT.

7. If you have created a new batch highlight Save and press SELECT.

8. If you have edited an existing batch highlight Save and press SELECT to overwrite or to save as a new batch highlight Save as and press SELECT.

9. Press FINISH to confirm. This will complete the editing, save and return to the BATCH screen.
**20.3 Set the active batch**

Note: the pump must be stopped to enter **DISPENSE SETTINGS**.

1. Press **MODE** to display the **CHANGE MODE** menu.

2. Using the ▲ /▼ keys, scroll to **Dispense** and press **SETTINGS**.
1. Using the \( \wedge / \vee \) keys, scroll to **Active batch** and press **SELECT**

2. Choose the batch from the list of created batches and press **SELECT** to confirm.
20.4 Start dispensing

1. From the CHANGE MODE menu, highlight Dispense and press SELECT to use Dispense Mode.

2. The pump will display the DISPENSE screen.

<table>
<thead>
<tr>
<th>DISPENSE screen</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>1</strong></td>
</tr>
<tr>
<td><strong>2</strong></td>
</tr>
<tr>
<td><strong>3</strong></td>
</tr>
<tr>
<td><strong>4</strong></td>
</tr>
</tbody>
</table>
Start

Starts the pump, and the display background changes to grey. If the pump is already running, pressing this has no effect.

Stop

Stops the pump. The display background changes to white. If the pump is not running pressing this has no effect.

Info

Pressing the INFO function key will display further information.

End batch

1. Pause the batch
   i. If a Batch size has been entered, the batch will pause automatically when the number of fills completed equals the batch size.
   ii. If a Batch size is unlimited or to end a batch early, press STOP. Once the current fill has been completed, the batch will pause.
20.5 Dispense settings

Note: the pump must be stopped to enter DISPENSE SETTINGS.

1. Select MODE

2. Using the \( \wedge / \vee \) keys, scroll to DISPENSE and press SETTINGS

The following are available in dispense mode settings:

**Active batch**

Batch to be dispensed. Select from a list of created batches. To create a new batch refer to "Create a new batch or edit a batch" on page 98

**Batches**

A batch contains the batch size, active recipe, direction and start and end delay. You must create at least one batch and set it as the active batch before Dispense can start.

**Batch parameters**

Configure the following parameters:
Batch name

The batch name gives the user a convenient way to identify a batch. Maximum 12 characters. (A-Z, 0-9).

- Using the ∧/∨ keys, enter a character.
- Press NEXT to confirm your character and to move onto the next. Press PREVIOUS to move the cursor back one character.
- Move the cursor to the end or beginning of the entry field using NEXT or PREVIOUS. When the cursor is at the beginning or end of the entry field, press FINISH to store the entry.

Batch size

Enter the number of fills to be completed in the batch.

- Minimum - 1
- Maximum - 999999

Press ∧/∨ to scroll to less than 1 or above 999999 to select UNLIMITED batch size. The pump will continue to dispense until it is stopped by the user.

Active recipe

The recipe that will be used for this batch.

Direction

The pump may be set up so that the direction of rotor rotation is clockwise or counter-clockwise, whichever is required.

Please note, however, that for some pumpheads the tube life will be greater if the rotor rotates clockwise; and that performance against pressure will be maximised if the rotor rotates counter-clockwise. To achieve pressure in some pumpheads the pump must rotate counter-clockwise.

Start delay (batch)

Sets time delay between start signal and first dispense start of the batch.

Refer to "Dispense time delays diagram" on page 110.

End delay (batch)

Sets time delay at the end of the batch.

Refer to "Dispense time delays diagram" on page 110.

Recipes

A recipe contains all the parameters for the required dispense. The active recipe must be selected when editing the batch before the dispense can be started. Therefore you must have at least one recipe to start Dispense.

Recipe parameters

Configure the following parameters:
Recipe name
The recipe name gives the user a convenient way to identify a recipe.
Maximum 12 characters. (A-Z, 0-9).
• Using the \^_/ keys, enter a character.
• Press NEXT to confirm your character and to move onto the next. Press PREVIOUS to move the cursor back one character.
• Move the cursor to the end or beginning of the entry field using NEXT or PREVIOUS. When the cursor is at the beginning or end of the entry field, press FINISH to store the entry.

Volume
This sets the target dispense amount.
• Minimum = 0.1000 millilitres
• Maximum = 99999.9 millilitres

Speed
Rotor speed.

Table 18 - Maximum pump speed

| 530Pn/PnN | 220 rpm |

Excessive speed may cause splashing or foaming.

Anti-drip
If dripping occurs after the fill has completed, increase anti-drip to create "suck back" by momentarily reversing the direction of pumphead. Anti-drip is measured by the number of reverse steps 0-10. Anti-drip values are whole numbers between 0 and 10 where 10 is one complete reverse revolution of the rotor and 0 is no reverse revolution of the rotor.
When using anti-drip, prime the pump before starting each new batch. This will compensate for the volume of fluid that has been retracted due to anti-drip.
Note: To reduce dripping always use an appropriate filling needle and ensure it is perfectly vertical.

Start delay (Recipe)
Sets time delay between start signal and dose start.
Refer to "Dispense time delays diagram" on page 110.

End delay (Recipe)
Sets time delay between pumphead stop and dose complete signal.
Refer to "Dispense time delays diagram" on page 110.

Start ramp
This will set the rate of acceleration when the pump starts.
Can be set to a value between 1 and 5.
1 is the fastest acceleration, 5 is the slowest.
Note: Start ramp is not included in flow calibration.
Stop ramp
This will set the rate of deceleration when the pump stops.
Can be set to a value between 1 and 5.
1 is the fastest deceleration, 5 is the slowest.
Note: Stop ramp is not included in flow calibration.

Delete a recipe
1. Stop the pump.
2. From the CHANGE MODE menu, Using the ∧ / ∨ keys, scroll to Dispense and press SETTINGS for DISPENSE SETTINGS.
3. Using the ∧ / ∨ keys, scroll to Recipes and press SELECT.
4. Using the ∧ / ∨ keys, scroll to a recipe name and press SELECT to edit that recipe. The EDIT RECIPE screen is displayed.
5. Using the ∧ / ∨ keys, scroll to Delete recipe and press SELECT.

Note: The pump does not use the recipe name to identify a recipe. The pump uses the numerical position in the list of recipes to identify a recipe. Deleting a recipe may change that numerical position. After deleting a recipe, check your batch to make sure the assigned recipe is correct.

Note: The last remaining recipe cannot be deleted.

Dose adjust
Adjust the recipe volume by ±50 %. Applies adjustment to any active recipe. Set the value to 100% to use the volume defined in the recipe. Set the value to 150% to use +50% above the volume defined in the recipe. Set the value to 50% to use -50% below the volume defined in the recipe.

Resume interrupted
When on - the pump will resume a dose if interrupted by power cycle or if the user stops the batch. The batch will continue from the point it stopped.
When off - the operator must start dosing again following a power cycle. The batch will restart from the beginning.
20.6 Dispense time delays diagram

![Dispense time delays diagram](image)

Figure 20 - Dispense time delays

- **A**
  - Batch
  - (Note: diagrams shows a batch size of three.)

- **B**
  - Pump is stopped

- **C**
  - Pump is dispensing

1. Batch start delay ("Start delay (batch)" on page 107)
2. Recipe start delay ("Start delay (Recipe)" on page 108)
3. Recipe end delay ("End delay (Recipe)" on page 108)
4. Batch end delay ("End delay (batch)" on page 107)

21 Dispense with PROFINET® control

1. Add a recipe and batch using the HMI on the pump by following the procedure in "Create a new recipe or edit a recipe" on page 94 and "Create a new batch or edit a batch" on page 98
2. Leave the pump in Dispense mode and have the correct batch active ("Set the active batch" on page 102)
3. Lock the control of the pump using the PIN function ("PIN protection" on page 43)
4. Start/stop the pump using PROFINET® control.

22 Sensors

Sensors can be connected to the pump to display the value, warnings and errors on pressure and or flow as selected.
Attached sensors allow the user to configure warning and alarm set points on the pump.
Each pump can support a maximum of one flow sensor and one pressure sensor at the same time.
22.1 Sensor wiring

Make sure the sensor is correctly wired to the pump before proceeding with set up. ("Control wiring" on page 23 or "Input/output connectors" on page 30).

![Figure 21 - Sensor wiring](image1)

![Figure 22 - Sensor wiring](image2)
22.2 Setting up the sensors

1. From the CONTROL SETTINGS menu, using the ∧ / ∨ keys, scroll to Sensor settings option and press SELECT.

2. Using the ∧ / ∨ keys, scroll to Configure sensors option and press SELECT.
3. Using the  \(\uparrow\) \(\downarrow\) keys, scroll to **Flow** or **Pressure** option and press **SELECT**. This selects the type of sensor to configure.

4. A list of supported flow sensor families are displayed. The example in the image above shows supported flow sensors. Using the  \(\uparrow\) \(\downarrow\) keys, scroll to the desired flow sensor and press **SELECT**.
5. The input that the sensor is attached to needs to be assigned.

6. Using the \( \wedge / \vee \) keys, scroll to the desired flow sensor and press SELECT.
7. See "PROFINET® control wiring" on page 21 section for connection specifications.

8. Using the ∧ / ∨ keys, scroll to the desired sensor size and press SELECT.

9. Using the ∧ / ∨ keys, scroll to the desired output unit and press SELECT.

10. This choice will alter the units displayed on the home screen.

Set Alarm and Warning level

1. Using the ∧ / ∨ keys, scroll to the alarm level to set up and press SELECT.
2. Using the \( \wedge / \vee \) keys, enter a value and press SELECT to store. Each one of these defaults to none, once the user sets a value in the edit screens the alarm/warning will become active.

3. When a warning level is triggered the top or bottom bars will show orange.
4. When an alarm band is triggered the pump will display the “sensor alarm detected” screen and the pump will stop.

22.3 Start up delay
Sets the delay from the motor starting to the alarms/warnings activating. Start-up delay activates on a motor start (irrelevant of mode, includes MAX).

1. From the control settings menu, using the \( \wedge / \vee \) keys, scroll to Sensor settings option and press SELECT
2. From the control settings menu, using the ▲ / ▼ keys, scroll to Set sensor delay option and press SELECT.

3. Using the ▲ / ▼ keys, set a value and press SELECT to store.

22.4 Generic sensors

Generic Sensors allow any sensor with a 4-20 mA output and a linear response to be used on the system. The sensor max flow/pressure ratings are shown in a table at the end of this section.
1. From the control settings menu, using the \(\uparrow/\downarrow\) keys, scroll to **Sensor settings** option and press **SELECT**

2. Using the \(\uparrow/\downarrow\) keys, scroll to **Configure sensors** option and press **SELECT**
3. Using the \( \wedge / \vee \) keys, scroll to **Flow** or **Pressure** option and press **SELECT**. This selects the type of sensor to configure.

4. Using the \( \wedge / \vee \) keys, scroll to **Generic flow sensor** or **Generic pressure sensor** option and press **SELECT**.
5. Using the \( \uparrow \downarrow \) keys, scroll to **4-20mA input 1** or **4-20mA input 2** option and press **SELECT**. This depends on which connection the user has connected the sensor to. See "PROFINET® control wiring" on page 21 section for connection specifications. Only generic sensors which provide a 4-20 mA output are supported.

6. Using the \( \uparrow \downarrow \) keys, select the sensor unit output type and press **SELECT**. Options in table below depending on sensor type selection:
Table 19 - Sensor units

<table>
<thead>
<tr>
<th>Flow</th>
<th>Pressure</th>
</tr>
</thead>
<tbody>
<tr>
<td>ul/min</td>
<td>Bar</td>
</tr>
<tr>
<td>ml/min</td>
<td>Psi</td>
</tr>
<tr>
<td>ml/hr</td>
<td></td>
</tr>
<tr>
<td>l/min</td>
<td></td>
</tr>
<tr>
<td>l/min</td>
<td></td>
</tr>
</tbody>
</table>

7. After selecting the sensor unit type the user will progress onto the GENERIC SENSOR VALUES screen.

8. Using the ▲▼ keys, scroll to Set 4mA value
9. Using the ∧/∨ keys, change the value reported when the sensor input is at 4 mA. Once satisfied with the value press **SELECT**.

10. Using the ∧/∨ keys, scroll to **Set 20mA value**
11. Using the \(\triangle\) or \(\triangledown\) keys, change the value reported when the sensor input is at 20 mA. Once satisfied with the value press SELECT.

12. Depending on the sensor and units selected the maximum values that can be set at below

<table>
<thead>
<tr>
<th>Table 20 - Sensor pressure limits</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pressure Unit</td>
</tr>
<tr>
<td>PSI</td>
</tr>
<tr>
<td>Bar</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Table 21 - Sensor flow limits</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flow Unit</td>
</tr>
<tr>
<td>ul/min</td>
</tr>
<tr>
<td>ml/min</td>
</tr>
<tr>
<td>ml/hr</td>
</tr>
<tr>
<td>l/min</td>
</tr>
<tr>
<td>l/hr</td>
</tr>
</tbody>
</table>

**Alarm / warning levels**

The Warning / error levels screen will then be shown, refer to "Set Alarm and Warning level" on page 115. The error and warning values will default to the value set at 4 mA and 20 mA. The user should set up warnings and errors to suit their process.
Example

If using a 4-20 mA sensor with a range of 0-10 psi:
- Set the 4 mA to 0 psi
- Set the 20 mA to 10 psi
- The Alarm Max was set at 8 psi
- The Warning Max was set at 7 psi
- The Warning Min was set at 3 psi
- The Alarm Min was set at 2 psi

An alarm event is indicated by the solid lines (A_L, A_H) on the graph. During an alarm event the pump will show the alarm red screen and stop. This alarm is triggered by the sensor signal being equal to or greater than that set by the Alarm Max/Min or Ethernet Hi-Hi/Lo-Lo Parameters. The user has to acknowledge this screen on the pump.

A warning event is indicated by the dashed lines (W_L, W_H) on the graph. During a warning event the pump will show orange sections on the screen and a warning bit will flag on the Ethernet communications. This event is triggered by the sensor signal being equal to or greater than the value set by the Warning Max/Min or Ethernet Hi-Lo/Lo-Hi Parameters.

Note: It is normal to expect fluctuations in both pressure and flow systems using peristaltic pumps. This means that warning and alarm limits need to take short term spikes and changes into account when setting these limits.

Note: The pump has no control over the accuracy of the signals coming from the sensors and will simply respond to the signal levels received. Sensor accuracy is the responsibility of the sensor supplier and will be dependent on a range of system variables, for example fluid type, tube material and temperature.
Procedure

1. From the GENERIC SENSOR VALUES screen.

2. Using the $\wedge$/\$ keys, scroll to Alarm / warning levels
3. Using the \( \wedge / \) keys, select the value to change and press SELECT.

4. Using the \( \wedge / \) keys, scroll to the desired value and press SELECT.

5. Press BACK to store the changes and return to the GENERIC SENSOR VALUES screen.
Scaling factor for generic sensors

Set slope adjust

The slope parameter will scale the slope of the channel as defined by the 4mA and the 20mA points. The parameter can take a value from 0.8 to 1.2 where 1 will result in no change to the slope.

Figure 24 - Set slope adjust

<table>
<thead>
<tr>
<th>A</th>
<th>Sensor configuration determined by the 4mA value and 20mA value</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>Set slope adjust is greater than 1</td>
</tr>
<tr>
<td>C</td>
<td>Set slope adjust is less than 1</td>
</tr>
<tr>
<td>$y_1$</td>
<td>4mA value (&quot;Generic sensors&quot; on page 118)</td>
</tr>
<tr>
<td>$y_2$</td>
<td>20mA value (&quot;Generic sensors&quot; on page 118)</td>
</tr>
</tbody>
</table>
Procedure

1. From the **GENERIC SENSOR VALUES** screen.

2. Using the ∧/∨ keys, scroll to **Set slope adjust**
3. Using the \( \wedge / \vee \) keys, scroll to the desired value and press **SELECT**

**Set offset adjust**

The offset parameter will apply an offset across the mA range of the channel and not affect the slope.

\[
\begin{align*}
\text{mA} & \quad 1 \quad 2 \quad 3 \quad 4 \quad 5 \quad 6 \quad 7 \quad 8 \quad 9 \quad 10 \quad 11 \quad 12 \quad 13 \quad 15 \quad 16 \quad 17 \quad 18 \quad 19 \quad 20 \\
\end{align*}
\]

**Figure 25 - Set offset adjust**

- **A** Sensor configuration determined by the 4mA value and 20mA value
- **B** Set offset adjust is greater than 1
- **C** Set offset adjust is less than 1
- **y_1** 4mA value
- **y_2** 20mA value
Procedure

1. From the *GENERIC SENSOR VALUES* screen.

2. Using the $\wedge/\vee$ keys, scroll to *Set offset adjust*
3. Using the \(^{\uparrow}\) keys, scroll to the desired value and press SELECT

22.5 Flow sensor reading

1. The flow sensor value can be read via the Flow sensor reading screen
## Troubleshooting

**If the pump display remains blank when the pump is switched on, make the following checks:**
- Check that the mains power is available to the pump.
- Check the fuse in the wall plug if one is present.
- Check the position of the voltage selector switch.
- Check the mains power switch at the rear of the pump.
- Check the fuse in the fuse holder in the centre of the switch plate at the rear of the pump.

**If the pump runs but there is little or no flow, make the following checks:**
- Check that fluid is supplied to the pump.
- Check for any kinks or blockages in the lines.
- Check that any valves in the line are open.
- Check that the tube and rotor are in the pumphead.
- Check that the tube is not split or burst.
- Check that the correct wall-thickness tube is being used.
- Check the direction of rotation.
- Check that the rotor is not slipping on the drive shaft.

**If the pump turns on, but will not run:**
- Check the remote stop function and configuration.
- Check the mode you are in, are you in **Analog** mode.
- Try to operate and run the pump in **Manual** mode.

### Error codes

If an internal error occurs, an error screen with a red background is displayed. Note: Signal out of range, over signal and leak detected error screens report the nature of an external condition. They do not flash.

<table>

26 Pumphead replacement

Always isolate the pump from the mains power supply before opening any guard or track, or performing any positioning, removal or maintenance operation.

Primary safety is provided by the tool-lockable pumphead track. Secondary (backup) protection is provided in the form of an optional guard switch which stops the pump if the pumphead track is opened. The optional guard switch on cased pumps should never be used as primary protection. Always disconnect the mains power supply to the pump before opening the pumphead guard.

29 Performance data

29.1 Performance curves

Flow rates of suction and discharge pressures for the pumphead at different drive speeds. This data was produced pumping water at ambient temperature.

Figure 34 - Marprene TH element, 4-7 bar (60-100 psi), 200 rpm, counter-clockwise rotation

Figure 35 - Maxthane LoadSure Elements, Counter clockwise Rotation 200 rpm RET rotor

Note: To achieve the discharge pressures stated above, the rotor must be run counter clockwise. To achieve optimal tube life, run the rotor clockwise at a maximum discharge pressure of 2 bar.
30 Trademarks

Watson- Marlow, LoadSure, Qdos, ReNu, LaserTraceability, Pumpsil, PureWeld XL, Bioprene, Marprene, Maxthane are registered trademarks of Watson-Marlow Limited. Tri-Clamp is a registered trademark of Alfa Laval Corporate AB.

STA-PURE Series PCS and STA-PURE Series PFL are trademarks of W.L.Gore and Associates.

PROFINET® is a registered trademark of PROFIBUS and PROFINET International (PI)

Siemens is a registered trademark of Siemens AG.
SciLog® and SciPres® are registered trademarks of Parker Hannifin Corporation.
BioProTT™ is a trademark of em-tec GmbH.
PendoTECH® and PressureMAT® are registered trademarks of PendoTECH
FLEXMAG™ is a trademark of KROHNE Messtechnik GmbH
SONOFLOW® is a trademark and brand of SONOTEC Ultraschallsensorik Halle GmbH.
